List of Unicode characters

As of [Unicode version 14.0](#), there are 144,697 [characters](#) with [code points](#), covering 159 modern and historical scripts, as well as multiple symbol sets. As it is [not technically possible](#) to list all of these characters in a single Wikipedia page, this list is limited to a subset of the most important characters for English-language readers, with links to other pages which list the supplementary characters. This article includes the 1062 characters in the Multilingual European Character Set 2 ([MES-2](#)) subset, and some additional related characters.

Character reference overview

HTML and XML provide ways to reference Unicode characters when the characters themselves either cannot or should not be used. A *numeric character reference* refers to a character by its [Universal Character Set/Unicode code point](#), and a *character entity reference* refers to a character by a predefined name.

A *numeric character reference* uses the format

`&#nnnn;`

or

`&#xhhh;`

where *nnnn* is the code point in [decimal](#) form, and *hhhh* is the code point in [hexadecimal](#) form. The *x* must be lowercase in XML documents. The *nnnn* or *hhhh* may be any number of digits and may include leading zeros. The *hhhh* may mix uppercase and lowercase, though uppercase is the usual style.

In contrast, a *character entity reference* refers to a character by the name of an *entity* which has the desired character as its *replacement text*. The entity must either be predefined (built into the markup language) or explicitly declared in a [Document Type Definition \(DTD\)](#). The format is the same as for any entity reference:

`&name;`

where *name* is the case-sensitive name of the entity. The semicolon is required.

Because numbers are harder for humans to remember than names, character entity references are most often written by humans, while numeric character references are most often produced by computer programs.^[1]

Control codes

65 characters, including [DEL](#). All belong to the [common](#) script.

	Code	Decimal	Octal	Description	Abbreviation / Key

Footnotes:

¹ Control-C has typically been used as a "break" or "interrupt" key.

² Control-D has been used to signal "end of file" for text typed in at the terminal on Unix / Linux systems. Windows, DOS, and older minicomputers used Control-Z for this purpose.

³ Control-G is an artifact of the days when teletypes were in use. Important messages could be signalled by striking the bell on the teletype. This was carried over on PCs by generating a buzz sound.

⁴ Line feed is used for "end of line" in text files on Unix / Linux systems.

⁵ Carriage Return (accompanied by line feed) is used as "end of line" character by Windows, DOS, and most minicomputers other than Unix- / Linux-based systems

⁶ Control-O has been the "discard output" key on minicomputers. Output is not sent to the terminal, but discarded, until another Control-o is typed.

⁷ Control-Q has been used to tell a host computer to resume sending output after it was stopped by Control-S.

⁸ Control-S has been used to tell a host computer to postpone sending output to the terminal. Output is suspended until restarted by the Control-Q key.

⁹ Control-U was originally used by Digital Equipment Corporation computers to cancel a line of typed-in text. Other manufacturers used Control-X for this purpose.

¹⁰ Control-X was commonly used to cancel a line of input typed in at the terminal.

¹¹ Control-Z has commonly been used on minicomputers, Windows and DOS systems to indicate "end of file" either on a terminal or in a text file. Unix / Linux systems use Control-D to indicate end-of-file at a terminal.

Latin script

The Unicode Standard (version 14.0) classifies 1,475 characters as belonging to the Latin script.

Basic Latin

95 characters; the 52 alphabet characters belong to the Latin script. The remaining 43 belong to the common script.

The 33 characters classified as **ASCII Punctuation & Symbols** are also sometimes referred to as **ASCII special characters**. See § Latin-1 Supplement and § Unicode symbols for additional "special characters". Certain special characters can be used in passwords; some organizations require their use. See the List of Special Characters for Passwords.
